ised Yang-Baxter

◆□▶ ◆□▶ ▲□▶ ▲□▶ ■ ののの

• Let *R* be linear $V \otimes V \longrightarrow V \otimes V$.

Definition

The Yang-Baxter equation for R is

$$(R \otimes I) \circ (I \otimes R) \circ (R \otimes I) = (I \otimes R) \circ (R \otimes I) \circ (I \otimes R)$$

An equality of linear maps $V^{\otimes 3} \longrightarrow V^{\otimes 3}$. (*I* = identity)

What is the Yang-Baxter equtaion?

- Let V be a vector space (module, abelian group, ...)
- Let *R* be linear $V \otimes V \longrightarrow V \otimes V$.

Definition

The Yang-Baxter equation for R is

$$({\it R}\otimes{\it I})\circ({\it I}\otimes{\it R})\circ({\it R}\otimes{\it I})=({\it I}\otimes{\it R})\circ({\it R}\otimes{\it I})\circ({\it I}\otimes{\it R})$$
 .

An equality of linear maps $V^{\otimes 3} \longrightarrow V^{\otimes 3}$. (*I* = identity)

Can be written alternatively as

$$R_{12}R_{23}R_{12}=R_{23}R_{12}R_{23}.$$

Overview o	The Yang-Baxter equation	Quantum groups ●o⊙	Recent developments	Generalised Yang-Baxter

A large and interesting source of solutions to the Yang-Baxter equation comes from *quantum groups*.

- Given semisimple g and enveloping U(g), take its quantum enveloping algebra or quantum group Uq(g).
- U_h(𝔅) has a presentation (Drinfeld-Jimbo 1987) generated over ℂ[[h]] by

$$X_1, X_2, \ldots, X_n, Y_1, Y_2, \ldots, Y_n, H_1, H_2, \ldots, H_n$$

with relations

$$\begin{bmatrix} H_i, H_j \end{bmatrix} = 0, \quad [X_i, Y_j] = \delta_{ij} \frac{\sinh(d_i H_i/2)}{\sinh(hd_i/2)}, \\ \begin{bmatrix} H_i, X_j \end{bmatrix} = a_{ij}X_j, \quad [H_i, Y_j] = -a_{ij}Y_j, \\ \text{some others...}$$

 a_{ij} = Cartan matrix, d_i = root lengths, $q_i = e^{hd_i/2}$.

• In quantum groups we find things like *quantum integers* $[n]_q = \frac{q^n - q^{-n}}{q - q^{-1}} = q^{n-1} + q^{n-3} + \dots + q^{-n+1}.$

Overview o	The Yang-Baxter equation	Quantum groups	Recent developments	Generalised Yang-Baxter
A qua	ntum aroup			

A quantum group we're interested in: $U_{q\mathfrak{sl}}(1|1)$.

$$U_q(\mathfrak{sl}(1|1)) = \mathbb{Q}(q) \left\langle E, F, H^{\pm 1} \mid \begin{array}{c} E^2 = F^2 = 0, \\ EH = HE, FH = HF, \\ EF + FE = \frac{H - H^{-1}}{q - q^{-1}} \end{array} \right\rangle$$

Jones	\rightarrow Khovanov			

The Jones polynomial can be given as $U_{q\mathfrak{sl}}(2)$ quantum invariant or by *skein relations*. E.g. via Kauffman bracket $\langle K \rangle$:

$$\left\langle \begin{array}{c} \end{array}\right\rangle = \left\langle \begin{array}{c} \end{array}\right\rangle - q \left\langle \begin{array}{c} \end{array}\right\rangle \quad \left(\begin{array}{c} \end{array}\right\rangle, \quad \left\langle \bigcirc L \right\rangle = (q + q^{-1}) \left\langle L \right\rangle$$
$$(-1)^{n_{-}} q^{n_{+} - 2n_{-}}$$

 $J(K) = \frac{(-1)^{n-}q^{n+-2n-}}{q+q^{-1}} \langle K \rangle \quad n_{\pm} = \# \text{ right/left-handed crossings.}$

◆□▶ ◆□▶ ▲□▶ ▲□▶ ■ ののの

Overview o	The Yang-Baxter equation	Quantum groups	Recent developments ●○○○	Generalised Yang-Baxter
Jones	\rightarrow Khovanov			

The Jones polynomial can be given as $U_{q\mathfrak{I}}(2)$ quantum invariant or by *skein relations*.

E.g. via Kauffman bracket $\langle K \rangle$:

$$\left\langle \begin{array}{c} \end{array} \right\rangle = \left\langle \begin{array}{c} \end{array} \right\rangle - q \left\langle \begin{array}{c} \end{array} \right\rangle$$
, $\left\langle \bigcirc L \right\rangle = (q+q^{-1}) \left\langle L \right\rangle$
 $J(K) = rac{(-1)^{n_-}q^{n_+-2n_-}}{q+q^{-1}} \left\langle K \right\rangle$ $n_{\pm} = \#$ right/left-handed crossings

 So J(K) can be written as a sum over resolutions of crossings of K.

▲□▶ ▲□▶ ▲□▶ ▲□▶ □ のQで

Taking (Σ, V) a punctured disc (following ideas of Tian)...

The $MCG^+(\Sigma, V)$ action on curves γ gives an action on SFH.

Theorem (M.)

Let (Σ, V) be the disc with n punctures, so $MCG^+(\Sigma, V) \cong B_n$. The action of B_n on $SFH(\Sigma \times S^1, V \times S^1) \cong \mathbb{V}^{\otimes n}$ is isomorphic to the *R*-matrix action of $U_q \mathfrak{sl}(1|1)$ on $V_2^{\otimes n}$

So SFH obeys Yang-Baxter $R_{12}R_{23}R_{12} = R_{23}R_{12}R_{23}$.

Overview o	The Yang-Baxter equation	Quantum groups	Recent developments	Generalised Yang-Baxter ○○○●○

Some observations:

- Squares of surface decomposition can be regarded as fundamental representations of U_qsl(1|1).
- A direct connection between U_qsl(1|1) and Floer homology. (Also related work of Tian.)
- We actually obtain a *parametrised Yang-Baxter* equation

 $R_{12}(q_2)R_{23}(q_1)R_{12}(q_1) = R_{23}(q_1)R_{12}(q_1)R_{23}(q_2)$

(as *SFH* is a $\mathbb{Z}[H_1(\Sigma)]$ -module.)

- Generalises from the braid group to higher genus mapping class groups: "higher genus Yang-Baxter"
- Unlike standard quantum invariants ("0 + 1-dimensional"), this invariant is 2 + 1-dimensional.
